Assignment 11

Aim. Implement a c program using recursion to calculate the factorial of a given number and display all the factorials from 1 to n

Theory

Recursion is a programming technique where a function calls itself to solve smaller instances of the same problem

Factorial function

if n=0 or n=1 then it returns 1

otherwise it returns n x factorial(n-1)

~~Before that it prints the numbers~~

~~There~~ Print factorials

It has a current and a number to end. It calls factorial starting from 1 to n ~~and recursively~~ and prints it.

It recursively ~~prints~~ calls itself ~~to~~, increasing the start by 1.

Conclusion

We have daisy chained recursion and calling a recursive function from another recursive function and how to efficiently manage it all to give a desired output.
